# Лабораторна робота №6

#### ПОЛІМОРФІЗМ

**Мета роботи.** Отримати знання про парадигму ООП – поліморфізм; навчитися застосовувати отримані знання на практиці.

# 1. Завдання до роботи

## Варіант 6.

Загальне завдання: Модернізувати попередню лабораторну роботу шляхом:

- додавання ще одного класу-спадкоємця до базового класу. Поля обрати самостійно;
  - базовий клас зробити абстрактним. Додати абстрактні поля;
- розроблені класи-списки поєднуються до одного класу таким чином, щоб він міг працювати як з базовим класом, так і з його спадкоємцями. При цьому серед полів класу-списку повинен бути лише один масив, що містить усі типи класів ієрархії. Оновити методи, що працюють з цим масивом.
  - 2. Опис класів, змінних, методів та функцій

#### 2.1 Опис класів

Базовий клас: Task.

Класи-спадкоємці: Inheritor, Inheritor2;

Клас, що має в собі масив базового класу та методи для роботи з ним: List.

Клас, що відображає агрегативні відносини з базовим класом: Student.

Клас, що відображає композитивні відносини з базовим класом: Date.

#### 2.2 Опис змінних

int mark – оцінка за роботу (Task).

int countOfDoneExercises – кількість виконаних завдань (Task).

int studentIndex – індекс студента (Task).

string name – ім'я студента (Task).

int rgz – кількість ргз (Task).

Student age – вік студента (Student).

Date date – дата написання (Date).

int rgzForTeacher – кількість ргз для керівника (Inheritor).

string maleFemale – стать студента (Inheritor2).

int listSize – розмір масиву елементів класу List.

Task\*\* studentList – масив елементів класу Task.

List list – об'єкт класу List.

Student age – об'єкт класу Student.

Student\* studentAge – масив, що зберігає інформацію про вік кожного студента

List test – об'єкт класу List.

2.3 Опис методів

Task\*\* createList(int, Student\*) – створення масиву елементів і заповнення даними (List).

Task\*\* newStudent(Student\*, int) – дані стандартних студентів (List).

void printAll(Task\*\*) const – виведення даних елементів у консоль (List).

void printOneStudent(stringstream&) const – виведення даних одного студента у консоль (List).

Task\*\* addStudent(Task\*, Task\*\*) – додавання нового елементу в масив (List).

Task\*\* deleteStudent(int, Task\*\*) – видалення елемента з масиву (List).

int getStudentID(int, Task\*\*)const – отримання даних елемента по індексу (List).

int getStudentRGZ(int, Task\*\*)const - отримання даних елемента по кількості ргз (List).

Task\*\* ReadFile(string) – читання даних з файлу (List).

int FileString(string) – кількість рядків у файлі (List).

void WriteFile(string) const – запис даних у файл (List).

Task\*\* enterNewStudent() – введення нового студента з клавіатури (List).

int regexTask(List&) — виведення на екран об'єктів, які в полі string мають 2 слова (List).

static bool sortAsc(const int&, const int&) – функція, що визначає напрям сортування (List).

static bool sortDesc(const int&, const int&) – функція, що визначає напрям сортування (List).

void sort(comp) – сортування масиву (List).

virtual void print() const = 0 – чисто-віртуальний метод виводу на екран (Task).

virtual stringstream getStr() const = 0 — чисто-віртуальний метод заповнення рядку інформацією (Task).

virtual void writeInFile(ofstream&) = 0 – чисто-віртуальний метод запису даних у файл (Task).

void print() const override – метод, що виводить об'єкт на екран, залежно від даних у цьому об'єкті (Inheritor, Inheritor2).

stringstream getStr() const override – метод, що заповнює рядок різними даними, залежно від ситуації (Inheritor, Inheritor2).

void writeInFile(ofstream&) override — метод, що записує дані у файл (Inheritor, Inheritor2).

Task() – конструктор за змовчуванням (Task).

Task(int, string, Student, int, int, sint, sint, sint) – конструктор з аргументами (Task).

Task(const Task&) – конструктор копіювання (Task).

Inheritor() – конструктор за змовчуванням (Inheritor).

Inheritor(int, string, Student, int, int, sint, sint, sint, int) – конструктор з аргументами (Inheritor).

Inheritor(const Inheritor&) – конструктор копіювання (Inheritor).

Inheritor2() – конструктор за змовчуванням (Inheritor).

Inheritor2(int, string, Student, int, int, int, sint, sint, sint, string) – конструктор з аргументами (Inheritor).

Inheritor2(const Inheritor2&) – конструктор копіювання (Inheritor).

virtual ~Task() – віртуальний деструктор (Task).

- ~List() деструктор (List).
- ~Inheritor() override;
- ~Inheritor2() override;
- 2.4 Опис функцій

void Menu() – функція меню.

int generateID() – функція, що надає кожному об'єкту унікальний індекс.

int generateRGZ() — функція, що надає кожному об'єкту унікальну кількість ргз.

Task\*\* TestAddStudent(List&, Student\*, Task\*\*) – тест функції додавання об'єкта до масиву об'єктів.

Task\*\* TestDeleteStudent(List&, Task\*\*) – тест функції видалення об'єкта з масиву об'єктів.

void TestGetStudenttID(List&, Task\*\*) – тест функції повернення індексу студента.

void TestReadFile(List&, Task\*\*) – тест функції читання даних з файлу. void TestSort(List&, Task\*\*) – тест функції сортування масиву.

         int beforeSorting = stud[0]->getMark();
         test.sort(test.sortDesc);
```

}

# 4. Результати роботи програми

Рисунок 1 – Робота класів-спадкоємців

#### 5. Висновки

Під час виконання лабораторної роботи було додано другий класспадкоємець, зроблено базовий клас абстрактним, додано абстрактні поля до базового класу, класи-списки поєднані до одного класу таким чином, що він може працювати як з базовим класом, так і з класами-спадкоємцями, зроблено єдиний масив, що може містити усі типи даних та оновлено методи, що працюють з цим масивом.

Програма протестована, виконується без помилок, витоків пам'яті немає.
